

Service Manual

Color Television TC-214NP/TC-214NPR Chassis No. RBX-M11E

(TC-214NP)

(TC-214NPR)

The service technician is required to read and follow the "Safety Precautions" and "Important Safety Notice" in this service manual.

Specifications

Power Source:	AC 120 — 240 V, 50/60 Hz	Audio Output:	2 W (10 % Distortion)
Power Consumption:	TC-214NP 83 W TC-214NPR 90 W	Speaker:	4 inches Round, 16Ω
Antenna Impedance:	300Ω balanced type for UHF, VHF 75Ω coaxial type for VHF	Picture Tube:	19 inches measured diagonal
Receiving Channels:	NTSC 2-13, (VHF), 14-83 (UHF) PAL 2-12 (VHF), 21-69 (UHF)	High Voltage:	23.3 kV \pm 1.5 kV 1.3 kV
Receiving Systems:	NTSC-M, PAL-B, G, I	Automatic Circuit:	Automatic Fine Tuning Automatic Gain Control Automatic Color Control Automatic Frequency and Phase Control Horizontal-AFC Automatic Beam Current Limiter Automatic Degussing
Intermediate Frequency:	Video I-F carrier 38.0 MHz Sound I-F carrier 32.0 MHz (PAL I) 32.5 MHz (PAL B, G) 33.5 MHz (NTSC) Color sub carrier 33.57 MHz (PAL) 34.42 MHz (NTSC)	Dimensions:	Height 42.8 cm (16-27/32 inches) Width 63.7 cm (25-3/4 inches) Depth 47.4 cm (18-21/32 inches)
Semiconductors:	TC-214NP TC-214NPR	Weight:	25.5 kg (50-21/32 lbs.)
Transistors	28 39	Weight and dimensions shown are approximate. Specifications are subject to change without notice.	
Diodes	81 88		
Posistor	1 1		
Integrated Circuit	10 12

REPLACEMENT PARTS LIST	29

THESE MODELS COMPLY WITH DHHS RULES 21 CFR SUBCHAPTER J APPLICABLE AT DATE OF MANUFACTURE.

IMPORTANT SAFETY NOTICE

There are special components used in Panasonic TV sets which are important for safety. These parts are shaded on the schematic diagram and on the replacement parts list. It is essential that these critical parts should be replaced with manufacturer's specified parts to prevent X-RADIATION, shock, fire, or other hazards. Do not modify the original design without permission of Matsushita Electric.

ABBREVIATIONS USED IN THIS MANUAL

ABL Automatic Beam Limiter
 ACC Automatic Color Control
 AGC Automatic Gain Control
 AFT Automatic Fine Tuning
 APF Active Power Filter
 APC Automatic Phase Control

AVR Automatic Voltage Regulator
 CRT Cathode Ray Tube
 DY Deflection yoke
 FBT Flyback Transformer
 OTL Output Transformerless
 SEPP Single-Ended Push-Pull Circuit

SAFETY PRECAUTIONS

GENERAL GUIDELINES

1. It is advisable to insert an isolation transformer in the power line and AC supply before servicing a hot chassis.
2. When servicing, observe the original lead dress, especially the lead dress in the high voltage circuits. If a short circuit is found, replace all parts which have been overheated or damaged by the short circuit.
3. After servicing, see to it that all the protective devices such as insulation barriers, insulation papers, shields, and isolation R-C combinations, are properly installed.
4. Before turning the receiver on, measure the resistance between B+ line and chassis ground. Connect \ominus side of an ohmmeter to the B+ lines, and \oplus side to chassis ground. Each line should have more resistance than specified, as follows:
5. When the TV set is not to be used for a long period of time, unplug the power cord from the AC outlet.

B+ Line	Minimum Resistance
190V	100k Ω
111V	20k Ω
14V	300 Ω
12V	100 Ω

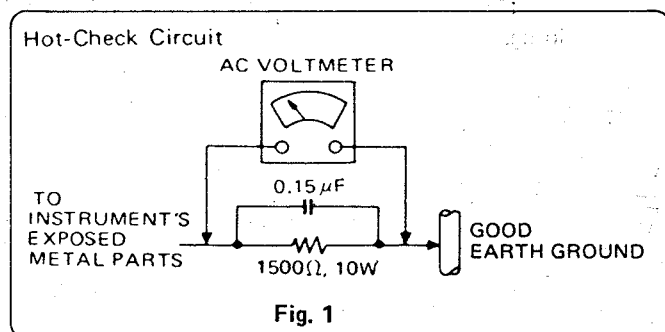

6. Potentials, as high as 24.8 kV are present when this receiver is in operation. Operation of the receiver without the rear cover involves the danger of a shock hazard from the receiver power supply. Servicing should not be attempted by anyone who is not thoroughly familiar with the precautions necessary when working on high-voltage equipment. Always discharge the anode of the picture tube to the receiver chassis before handling the tube.
7. After servicing make the following leakage current checks to prevent the customer from being exposed to shock hazards.

LEAKAGE CURRENT COLD CHECK

1. Unplug the AC cord and connect a jumper between the two prongs on the plug.
2. Turn on the receiver's power switch.
3. Measure the resistance value, with an ohmmeter, between the jumpered AC plug and each exposed metallic cabinet part on the receiver, such as screwheads, antennas, control shafts, handle bracket, etc. When the exposed metallic part has a return path to the chassis, the reading should be between 240 k Ω and 5.2 M Ω . When the exposed metal does not have a return path to the chassis, the reading must be ∞ .

LEAKAGE CURRENT HOT CHECK (See figure 1.)

1. Plug the AC cord directly into the AC outlet. Do not use an isolation transformer for this check.
2. Connect a 1.5 k Ω , 10 watts resistor, in parallel with a 0.15 μ F capacitor, between each exposed metallic part on the set and a good earth ground such as a water pipe, as shown in figure 1.
3. Use an AC voltmeter, with 1000 ohms/volt or more sensitivity, to measure the potential across the resistor.
4. Check each exposed metallic part, and measure the voltage at each point.
5. Reverse the AC plug in the AC outlet and repeat each of the above measurements.
6. The potential at any point should not exceed 0.75 volts RMS. A leakage current tester (Simpson Model 229 or equivalent) may be used to make the hot checks, leakage current must not exceed 1/2 milliamp. In case a measurement is outside of the limits specified, there is a possibility of a shock hazard, and the receiver should be repaired and rechecked before it is returned to the customer.

X-RADIATION

WARNING: 1. The potential source of X-Radiation in TV sets is the High Voltage section and the picture tube.

2. When using a picture tube test jig for service, make sure that jig is capable of handling 29.5 kV without causing X-Radiation.

NOTE: It is important to use an accurate periodically calibrated high voltage meter.

1. Turn the Brightness control fully counterclockwise.
2. Set the SERVICE switch to SERVICE.
3. Measure the High Voltage. The upper meter (electrostatic type) reading should indicate 23.3 kV ± 1.5 kV. If the upper meter indication is out of tolerance, immediate service and correction is required to prevent the possibility of premature component failure.
4. To prevent an X-Radiation possibility, it is essential to use the specified picture tube.
5. To prevent exposure to X-Radiation, the picture tube shield must be kept in place with power applied to the set.

HORIZONTAL OSC. DISABLE CIRCUIT TEST

This test must be made as a final check before the set is returned to the customer.

1. With the rear cover removed, supply a nominal 120V AC to the set, turn on the power switch.
2. Set the customer controls to normal operating positions.
3. Short between TPS10 on the main board and TPB12 on the (B) board with a jumper lead. Confirm that picture is black out.
4. If this does not occur, the horizontal oscillator disable circuit is not operating.
Follow instructions below for repair procedures before the set is returned to customer.

REPAIR PROCEDURES OF HORIZONTAL OSCILLATOR DISABLE CIRCUIT

1. Connect a DC voltmeter between TPS1 on the main circuit board and chassis ground.
If nearly +111V is not present on that point, find the cause. Check D831, D806, and IC801.
2. Connect a DC voltmeter between TPS10 on the main board and chassis ground.
If nearly +10.7V is not present on that point, check R508, R509, R518, C509, D501 and IC501.
3. Carefully check above specified parts and related circuits and parts. When the circuit is repaired, horizontal oscillator disable circuit test must be made again.

DISASSEMBLY INSTRUCTIONS

Proceudre	Block	Remove	Shown in Fig.

2	Tuning	Screws (B) x 2 (4)	3
3	Speaker	Screws (C) x 4	3

Fig. 2

Fig. 3

Fig. 4

Note: During servicing, it is desirable to put the receiver at the service position for easier servicing as shown in fig. 4.

FIELD ALIGNMENT

NO SPECIAL TEST EQUIPMENT REQUIRED

Alignment is normally made according to the general procedure.

For your information, the following describes simple alignment methods for which you use accurate meter and jumpers.

SUB-BRIGHT ADJUSTMENT

1. Connect the negative side of the VOLT OHM METER (3mA full scale range) to the TPS7 on E-Board, and the positive side to ground.
2. Receive Philips pattern.
3. Set the brightness control (R342) and contrast control (R340) to maximum. Set the color control (R671) to minimum.
4. Adjust sub brightness control (R559) to the reading of $1400\mu\text{A}$.

SOUND I-F ADJUSTMENT

1. Receive picture signal.
2. Receive relatively strong picture signal and turn the core of L201 within 2 turn until the maximum volume is obtained with the least buzz.
3. After the above adjustment, make sure of the above at all channels.

RF AGC CONTROL ADJUSTMENT

1. Receive normal picture signal.
2. Slowly turn the RF AGC control (R119) clockwise from where it was fully turned counterclockwise and set it at a point where noise is minimized.
3. Receive picture on all channels, and make sure that neither synchronize distortion nor cross modulation takes place.

AFC ADJUSTMENT

1. Receive normal picture signal.
2. Turn the core of L151 until the drawing of normal local frequency is obtain while watching the picture.

VERTICAL CIRCUIT ADJUSTMENT

1. Receive a color picture signal.
2. Adjust V-Hold controls R407 (PAL), R480 (NTSC) to achieve a stable picture.
3. Adjust V-Height controls R409 (PAL), R483 (NTSC) to obtain a normal picture.
4. Change the position of chips (E35 ~ E38) so that the picture is centered on the screen of the picture tube.

HORIZONTAL CIRCUIT ADJUSTMENT

1. Adjust H-Hold controls (R506 (PAL), R530 (NTSC) to achieve a stable picture.
2. Adjust the H-Center control (R517) so that the picture is centered on the screen of the picture tube.
3. Adjust the Bias control (R757) to obtain a normal picture.

POWER LINE CIRCUIT

1. Set the brightness control (R342) and contrast control (R340) to minimum position.
2. Connect VTVM between TPS1 and ground.
3. Adjust +B Adj. control (R811) to the reading of $113\text{V} \pm 1\text{V}$.

HEIGHT VOLTAGE ADJUSTMENT

1. Set the brightness control (R342) and contrast control (R340) to minimum position.
2. Connect high voltage meter (electrostatic type) to the anode of CRT and confirm that high voltage is within a range of $23.0\text{ kV} + 1.5\text{ kV} - 1.3\text{ kV}$.
3. If it's lower or higher, slightly adjust +B Adj. control (R811).

FOCUS ADJUSTMENT

Adjust Focus control (on F.B.T) to obtain a sharpest and clearest picture.

SERVICING ADJUSTMENT

COLOR PURITY ADJUSTMENT (See Fig. 5) **BEFORE ALL ADJUSTMENTS DESCRIBED BELOW ARE ATTEMPTED, V-HOLD, H-HOLD, V-HEIGHT, V-LINEARITY, B+ VOLTAGE AND FOCUSING ADJUSTMENTS MUST BE COMPLETED.**

1. Place the TV receiver facing NORTH or SOUTH.
2. Plug in TV receiver and turn it ON.
3. Operate the TV receiver over 10 minutes.
4. Fully degauss the TV receiver by using an external degaussing coil.
5. Receive a crosshatch pattern and adjust the static convergence control roughly.
6. Loosen the clamp screw of the deflection yoke and pull the deflection yoke toward you.
7. Fully turn the blue and red low light controls (R359, R361) counterclockwise and set the green low light control (R360) to its mid position.
8. Adjust the purity magnets so that green field is obtained at the center of the screen.
9. Slowly push the deflection yoke toward bell of CRT and set it where a uniform green field is obtained.
10. Tighten the clamp screw of the deflection yoke.

COLOR TEMPERATURE ADJUSTMENT (See Fig. 5)

1. Tune into black and white program.
2. Set all three low light controls to 45° turn clockwise from its counterclockwise position.

Note: a) If the illumination becomes too strong turn brightness control down.

b) Do not touch screen control, it is factory preset.

3. Set service switch (S301) to SERVICE position.
4. Turn contrast (R340) and brightness (R342) controls until first horizontal color line just illuminate on CRT.
5. Turn rest of two color's low light control until all three colors for equal level.
6. Set service switch (S301) back to NORMAL position.

7. Adjust drive controls (R354, R355) to achieve white raster at high brightness level.
8. Repeat steps 3 to 7 as necessary.

If the screen control (R371) is turned by mistake or it becomes necessary take following steps.

1. Receive a black and white picture signal.
2. Turn the blue, green and red low light controls (R359, R360, R361) to mid position.
3. Turn the screen control (R371) fully counterclockwise. Set the service switch (S301) to SERVICE position.
4. Set sub brightness control (R559) to mid position and set contrast (R340) and color (R671) controls to minimum position.
5. Turn the receiver ON.
6. Connect VTVM between TPY1 and earth, then adjust brightness control (R342) to the reading of +150V DC.
7. Slowly turn the screen control clockwise to the point where one of the three beams just illuminates.
8. Leave the low light control of the color which appeared at the step 5 as it is, and turn the remained two low light controls clockwise, from the setting position at the step 5, so as to get a white horizontal line on the picture tube.
9. Reset the service switch to NORMAL position.
10. Adjust red and blue drive controls to obtain a uniform white raster.
11. Check the black and white picture detail for proper black and white rendition (No coloration) from low-lights to highlights and at all brightness levels for proper tracking.

Proper tracking at all brightness levels can be obtained when the screen control, low light controls and drive controls are properly adjusted. If the results are unsatisfactory, repeat from the beginning.

Fig. 5

CONVERGENCE ADJUSTMENT (See Fig. 6)

1. Receive a dotted pattern.
2. Unfix the convergence magnet clumper and align red with blue dots at the center of the screen by rotating (R, B) Static convergence magnets.
3. Align red/blue with green dots at the center of the screen by rotating (RB-G) static convergence magnet.
4. Fix the convergence magnets by turning the clumper.
5. Remove the DY wedges and slightly tilt the deflection yoke horizontally and vertically to obtain the good overall convergence.
6. Fix the deflection yoke by wedges.
7. If purity error is found, follow "Purity Adjustment" instructions.

Fig. 6

RUBBER REPAIRING KIT FOR DEFLECTION YOKE ADJUSTMENT KIT PART NO. (TZF70302)

• Description

This repairing kit is used for adjusting purity and convergence when deflection yoke and picture tube are replaced.

• Parts

Code	Shape	Q'ty	Description
Ⓐ		3	Adjusting rubber
Ⓑ		3	Tape
Ⓒ		1	Tape
Ⓓ		1	Silicone adhesive tube

• How to use

Deflection yoke and picture tube replacement.

(For picture tube replacement, see number 2 below.)

1. Remove defective deflection yoke and old parts Ⓐ, Ⓑ, and Ⓒ from the picture tube.
2. Apply new part Ⓒ to the required place in the picture tube.
3. Insert new deflection yoke and static magnet into the picture tube.
4. Adjust the purity and convergence, referring to the setting and adjusting procedures.
5. Apply silicone adhesive to part Ⓐ using Ⓓ as shown in fig. 7. After removing the separator from part Ⓐ, insert part Ⓐ between picture tube and deflection yoke, and install the deflection yoke firmly.
6. Apply the tape Ⓑ over the part Ⓐ.

(Reference Figures)

GENERAL ALIGNMENT

CARRIER TRANSFORMER AND RESONANCE COIL ALIGNMENT

Preparation Step (See Fig. 8)

1. Supply AGC bias voltage to TPA2.
2. Connect output lead of VIF sweep generator between TPA1 and shield case.
3. Connect lead of FROM REC. between TPA12 and shield case.

4. Supply DC 14V to TPS5.
5. Turn the RF AGC control (R119) fully clockwise.
6. Set system switch to PAL position.
7. Supply DC 18V to TPB12.
8. Set system SW to PAL 5.5 MHz position.

Fig. 8

Alignment Step

1. Set AGC bias voltage at point where stabilized waveform with the minimum noise is obtained.
2. Adjust the level of sweep generator to obtain 1Vp-p output as in Fig. 9.
3. Adjust L104 for maximum amplitude around P.C. (Picture carrier 38.0 MHz)

Fig. 9

VIF ALIGNMENT

Preparation Step (See Fig. 10)

1. Earth BS and RF AGC terminal (No. ③ and ④ pin) of tuner.
2. Turn the RF AGC control fully clockwise.
3. Supply AGC bias voltage to TPA2.
4. Connect output lead of VIF sweep generator to tuner test point TP.
5. Connect lead of FROM REC. between TPA12 and shield case.

6. Connect resistor jumper (100Ω) between TPA3 and TPA4.

7. Supply DC 14V to TPS5 and supply DC 18V to TPB12.

8. Set channel setting switch to OFF position.

Note: All cores of transformers are required to be adjusted with respective upper side position.

Fig. 10

Alignment Step

1. Set system switch to PAL 6.0 MHz position.
2. Adjust AGC bias voltage for maximum amplitude of waveform.
3. Adjust the level of sweep generator to achieve 1Vp-p output.
4. Increase the output level of sweep generator by 20 dB.
5. Adjust AGC bias voltage to achieve 1Vp-p output. (on oscilloscope)
6. Adjust L133 (30.0 MHz and 39.5 MHz) to minimize adjacent carrier.
7. Set system switch to PAL 5.5 MHz position.
8. Adjust L170 to minimize adjacent carrier (31.0 MHz).
9. Set system switch to NTSC position.
10. Adjust T130 to achieve 1Vp-p output to minimize adjacent carrier 32.0 MHz.
11. Set system switch to PAL 5.5 MHz position.

Fig. 11

12. Increase the output level of sweep generator to achieve 1Vp-p output.
13. Adjust tuner converter coil to obtain the waveform as in fig. 12.
14. Set system switch to NTSC position.
15. Adjust AGC bias voltage for maximum amplitude of waveform.
16. Adjust the level of sweep generator to achieve 1Vp-p output.
17. Increase the output level of sweep generator by 12 dB.
18. Adjust AGC bias voltage to achieve 1Vp-p output.
19. Observe the position of picture carrier 38.0 MHz (30%).
20. Increase the output level of sweep generator by 12 dB.
21. Adjust T131 to obtain the 33.57 MHz.
22. Decrease the output level of sweep generator by 12 dB.
23. Observe the waveform as in fig. 13.

Fig. 12

Fig. 13

SIF ALIGNMENT

Preparation Step (See Fig. 14)

1. Connect output lead of SIF sweep generator between TPA16 and earth.
2. Connect input lead of oscilloscope between TPA10 and earth.
3. Supply DC 16V to TPS3 and supply DC 14V to TPS5.
4. Supply DC 18V to TPB12.
5. Connect capacitor jumper ($1\mu\text{F}/50\text{V}$ (NP)) between TPA12 and earth.
6. Supply AGC bias voltage.

Fig. 14

Alignment Step

1. Set system switch to PAL 6.0 MHz position.
2. Adjust output level of sweep generator to achieve 700 mVp-p (Open end).

Fig. 15

5. Set system switch to PAL 5.5 MHz position.
6. Adjust C277 so that sound carrier 5.5 MHz is centered as in fig. 16.
7. Set system switch to NTSC position.
8. Change the sweep generator with 4.5 MHz sweep generator.
9. Adjust C274 to obtain the waveform as in fig. 17.

3. Adjust L201 so that sound carrier (6.0 MHz) is centered as in fig. 15.
4. Observe the waveform as in fig. 16.

Fig. 16

Fig. 17

CHROMA ALIGNMENT (PAL)

HIGH PEAKER TRANSFORMER ALIGNMENT

Preparation Step

1. Connect output lead of chroma sweep generator to tuner test point.
2. Connect output lead of detector to TPB8.
3. Supply DC 14V to TPS5.
4. Supply AGC bias voltage to TPA2.
5. Connect resistor jumper (100Ω) between TPA3 and TPA4.
6. Connect short jumper between Bs terminal of tuner and earth.
7. Set controls as follows.
 Color control (R671) Maximum position
 Sub color control (R635) Mid. position
 DL control (R623) Mid. position
 Channel preset switch Preset position
 System switch. PAL 5.5 MHz position
8. Supply DC 18V to TPB12.
9. Connect short jumper between RF AGC terminal of tuner and earth.
10. Connect resistor jumper (100Ω) between TPB2 and TPB4.
11. Set select switch of chroma sweep generator to 38.0 MHz position.
12. Set select switch of chroma sweep generator to 5.5 MHz position.

Fig. 18

Alignment Step

1. Adjust AGC bias voltage to obtain the maximum output.
2. Adjust output level of chroma sweep generator to achieve 0.2Vp-p.
3. Increase the output level of sweep generator by 20 dB.
4. Adjust AGC bias voltage to achieve 0.2Vp-p.
5. Adjust T601 to obtain the waveform as in fig. 19.

Fig. 19

CHROMA ALIGNMENT (NTSC)

Preparation Step

1. Connect output lead of chroma sweep generator to tuner test point.
2. Set select switch of chroma sweep generator to IF position.
3. Supply DC 14V to TPS5.
4. Connect output lead of detector to TPB12.
5. Supply AGC bias voltage to TPA2.
6. Connect resistor jumper (100Ω) between TPA3 and TPA4.
7. Set channel setting control to VHF high position.
8. Connect short jumper between RF AGC terminal of tuner and earth.
9. Connect short jumper between BS terminal of tuner and earth.
10. Set controls as follows.

Channel setting switch Preset position
System switch. NTSC position
DL control (R623) Mid. position
NTSC Tint control (R616) Mid. position

11. Supply DC 18V to TPB12.
12. Connect resistor jumper (100Ω) between TPB2 and TPB4.

Alignment Step

1. Adjust AGC bias voltage -20 dB from the maximum gain.
2. Adjust output level of chroma sweep generator to achieve 0.2Vp-p.
3. Adjust T602 to obtain the waveform as in fig. 20.

Fig. 20

AFC FINAL ALIGNMENT

Preparation Step

1. Set system switch to PAL position.
2. Connect output lead of 38.0 MHz CW to tuner point TP.
3. Connect VTVM to TPA5.
4. Set channel setting control to OFF position.
5. Connect short jumper BS terminal of tuner and earth.

Alignment Step

1. Adjust T901 to the reading $6.5 \pm 0.3V$.
2. Vary the frequency of CW oscillator in $\pm 100kHz$ and observe the voltage of VTVM as follows.
+100kHz Less than 4V
-100kHz More than 9V

SUB CONTRAST ALIGNMENT

Alignment Step

1. Receive a color bar signal.
2. Connect oscilloscope to TPB10.
3. Set controls as follows.
Contrast control Max. position
Color control Min. position

4. Adjust bright control (R342) and sub brightness control (R559) to obtain the waveform as in fig. 21.
5. Adjust sub contrast control (R316) to obtain the waveform as in fig. 21.

Fig. 21

APC ADJUSTMENT (PAL)

1. Set controls as follows.

Color control Mid. position
 Sub color control Fully clockwise position
 Phase control Mid. position
 System switch. PAL position

2. Receive a Philips pattern.

3. Connect capacitor jumper ($0.1\mu\text{F}$) between TPB2 and TPB5.
4. Connect resistor jumper ($100\text{k}\Omega$) between.
5. Connect oscilloscope to TPB9 (R-out).
6. Adjust APC control (R640) so that the waveform becomes vertical and it is standing or is moving.

COLOR DEMODULATOR AND DELAY LINE ALIGNMENT

Alignment Step

1. Receive color bar signal and set channel setting switch to ON position.
2. Connect capacitor jumper ($10\mu\text{F}/16\text{V}$) between TPB3 and earth.
3. Set controls as follows.
 Color control (R671) Max. position
 Sub color control (R635) Mid. position
 Contrast control (R340) Max. position
 System switch. PAL position

4. Connect oscilloscope to TPB11.
5. Adjust Phase control (R614) to obtain the waveform as in fig. 22.
6. If the results are unsatisfactory, repeat from APC alignment.
7. Adjust L610, L611 and R623 to obtain the waveform as in fig. 22.

COLOR KILLER ALIGNMENT

Set controls as follows.

System switch. PAL 5.5 MHz position
 Color control Max. position
 Bright control Max. position
 Contrast control Max. position.

Note: Antenna connection is not required.

2. Adjust killer control (R630) to the point where color noise just disappeared.

NTSC APC AND NTSC TINT ALIGNMENT

1. Set system switch to NTSC position.
2. Receive NTSC color bar signal and channel setting switch to ON position.
3. Connect short jumper between TPB2 and TPB5.
4. Connect resistor jumper (100k Ω) between TPB2 and TPB4.
5. Connect oscilloscope to TPB11.
6. Adjust APC control (C638) so that the waveform becomes vertical and it is standing or is moving.
7. Receive NTSC rainbow color bar signal.
8. Set the Tint control (R670) to clockwise and adjust Sub Tint control (R616) to obtain the waveform as in fig. 23.

SUB COLOR ALIGNMENT

1. Set system switch to NTSC position.
2. Receive rainbow color bar signal.
3. Connect capacitor jumper (10 μ F/16V) between TPB3 and earth.
4. Set color and contrast controls to maximum position.

Fig. 24

Fig. 23

5. Connect oscilloscope to TPB9 and adjust sub color control (R635) to obtain the waveform as in fig. 24.
6. Set system switch to PAL 5.5 MHz position.
7. Confirm that amplitude of R-Y waveform is more than 2.1Vo-p at TPB9.

Fig. 25

CIRCUIT EXPLANATION

ELECTRONIC CHANNEL SELECTION CIRCUIT

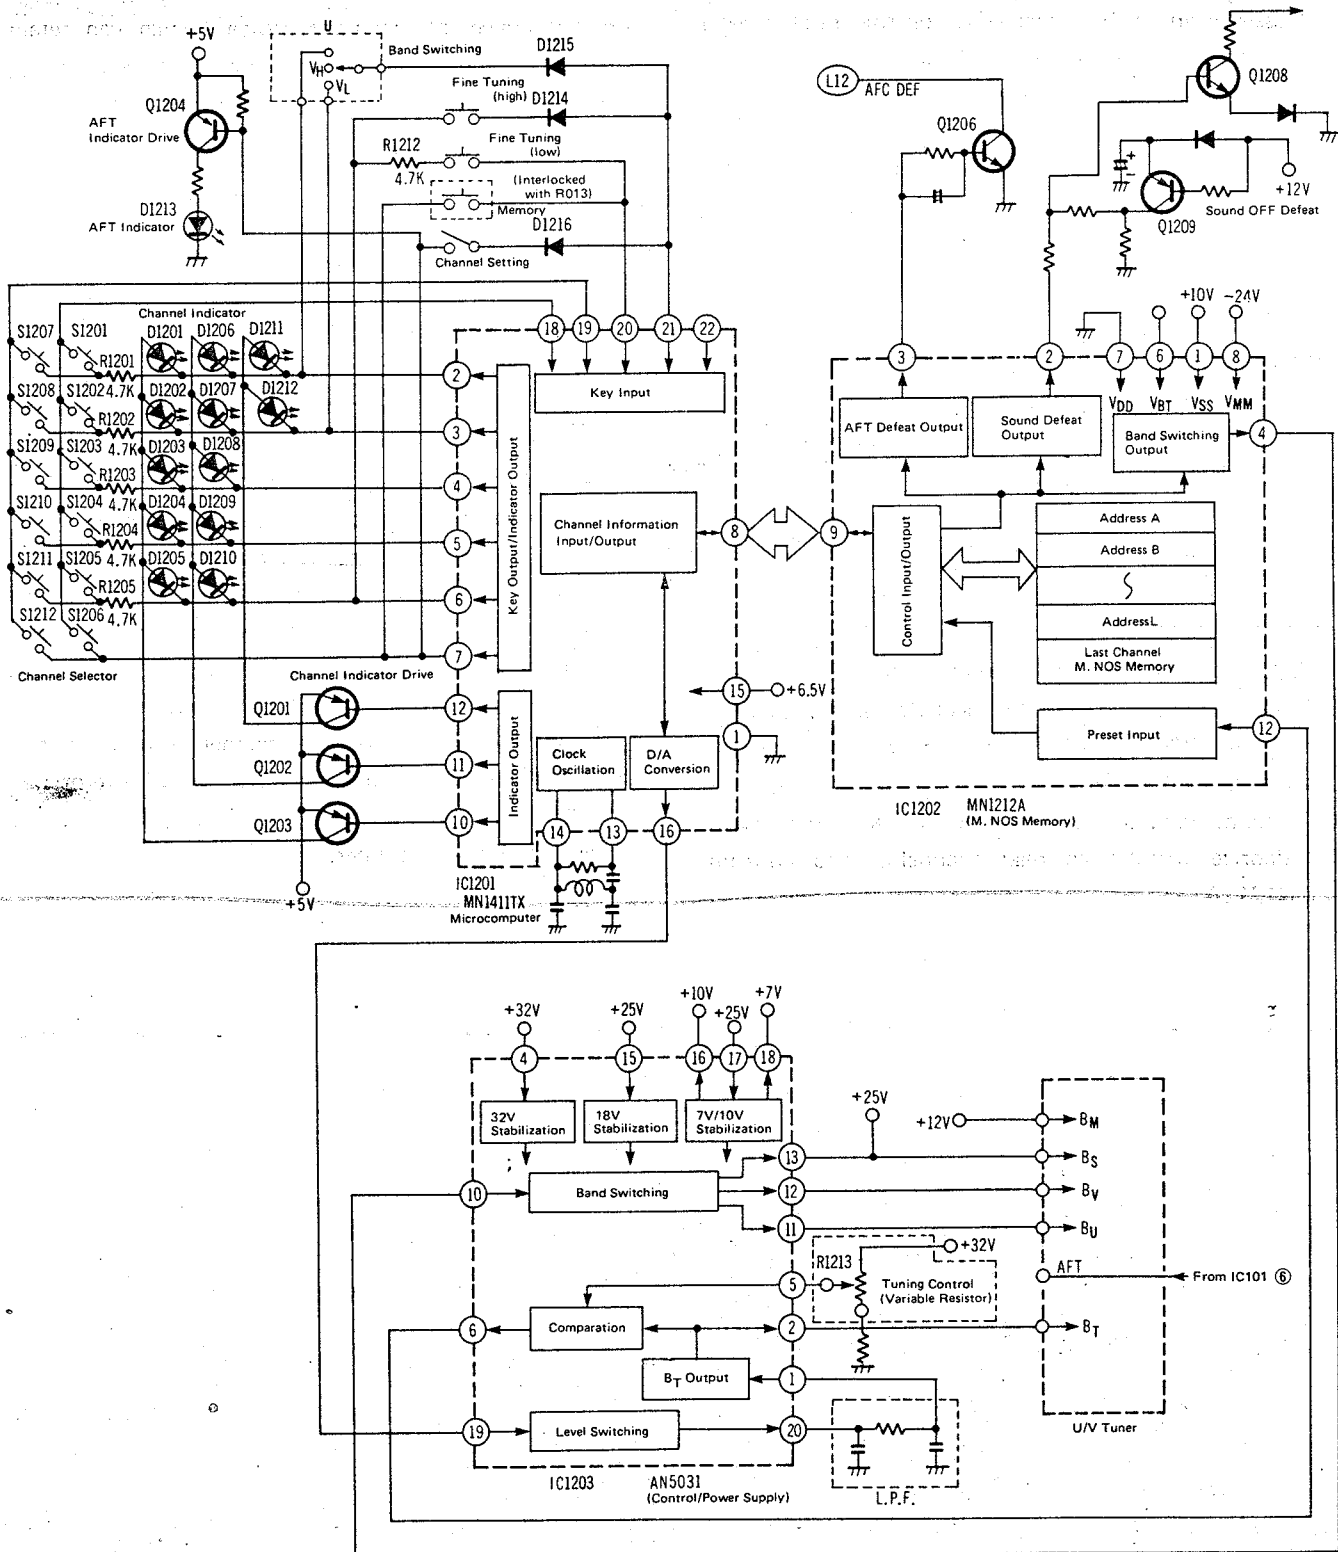

Fig. 26

A. M.NOS single-axis control preset electronic channel selection circuit.

1. The electronic channel selection circuit used in this chassis is an M.NOS single-axis control preset type, a kind of a voltage synthesizer channel selection circuit.
2. With the voltage synthesizer channel selection circuit, channel data (tuning voltage, band voltage, etc.) are converted into digital signals (represented by "1" and "0"), memorized in a semiconductor memory device, and fetched as required to receive the desired broadcast.

B. Signal flow

1. Channel data is treated as a 16-bit digital signal as described below.

- Tuning voltage (B_T voltage) 13 bits
- Band (V_L , V_H , UHF) 2 bits
- ON/OFF of local oscillation AFT 1 bit

16 bits

2. Twelve pieces of channel data are memorized in the address space (memory area) A-L of the M.NOS IC1202, MN1212A and fetched as required.

These addresses correspond respectively to the selection switches S1201 – S1212 (for example, address A corresponds to S1201.)

3. A microcomputer (IC1201, MN1411TX) functions to memorize (write)/fetch (read) channel data to and from MN1212A.

3. An M.NOS (metal-nitride-oxide semiconductor) memory, a non-volatile memory device (which can retain memory data for a certain period even when power supply ceases) is used as the semiconductor memory device in this system.

4. In channel presetting, the desired channel data selected by the microcomputer, via the band selection switch or tuning control, are converted into a 16-bits digital signal, and memorized in an M.NOS memory address selected with the selection switch.

5. During normal reception, channel data memorized in the M.NOS memory address corresponding to the selection switch position are read by the microcomputer.

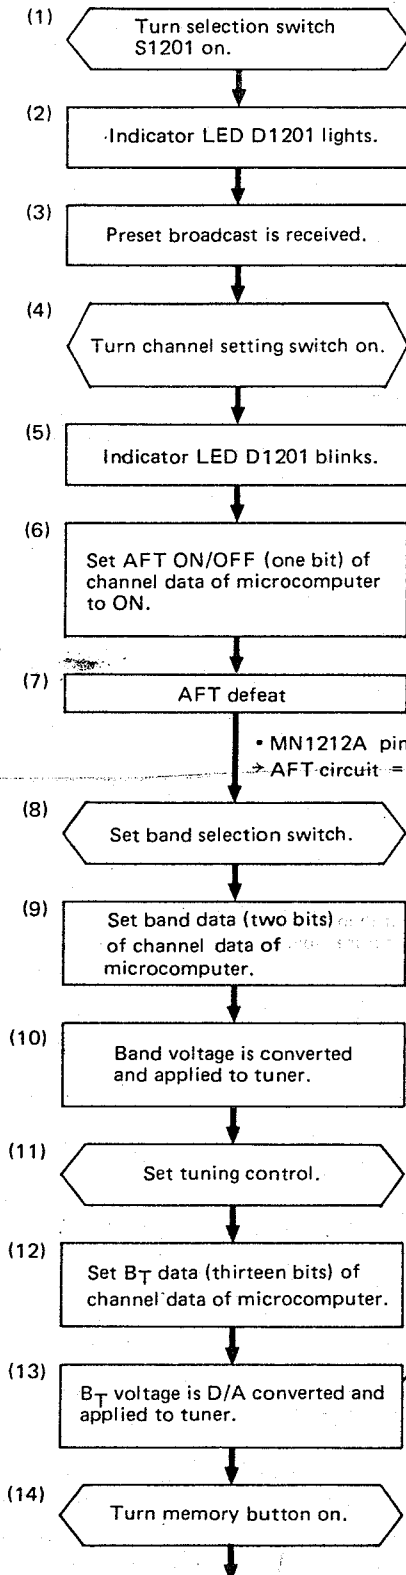

6. Channel data, a digital signal composed of "1" and "0", are converted by the channel selection control IC1203 (AN5031) and the conversion circuit of MN1212A into various voltages (B_T , B_V , B_U , B_S) which are required to drive the tuner.

C. Circuit functions

Major circuit functions are channel presetting and normal reception are explained below using the following flowchart.

(1) Functions at channel presetting

• Presetting position A

Signal Pin	Indicator output (MN1411TX)
⑩	
⑪	
⑫	
②	
③	
④	
⑤	
⑥	
⑦	

Table 1 Indicator output (when receiving broadcast preset at position A)

Signal Pin	Indicator output (MN1411TX)
⑩	

Table 2 Indicator output at channel presetting

Band selection switch position	Band data	MN1212A ④	AN5031		
			⑪ Bu	⑫ Bv	⑬ Bs
V _L	0 1	L (0V)	0 (0V)	1 (12V)	1 (24V)
V _H	1 0	M (5V)	0 (0V)	1 (12V)	0 (0V)
U	1 1	H (10V)	1 (12V)	0 (0V)	0 (0V)

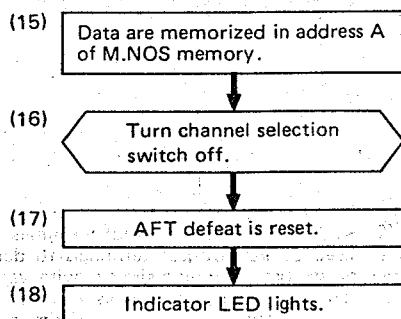

Table 3 Band selection output

Pin	Output
B _T data (13 bits)	
MN1411TX ⑩ AN5031 ⑪	
AN5031 ⑫	
AN5031 ⑬	

Table 4 B_T voltage output

Pins ② ~ ⑦ are indicator output terminals, and are also used as key output terminals to deliver negative pulses (key scanning signals) with various phases. The key output terminals and the key input terminals (pins ⑩ ~ ⑫) from a key matrix, and the microcomputer detects states of various button switches by identifying which phase of the key scanning signal is inputted to which key input terminal.

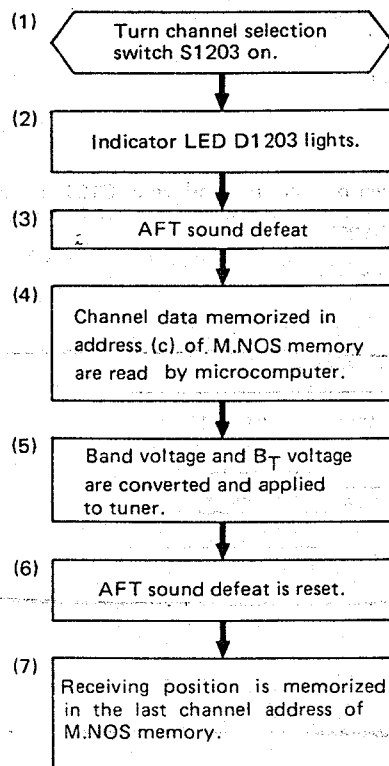

• When pin ⑩ becomes zero, Q1203 is turned on, and +5V applied to the anodes of D1201 ~ D1205.
When pin ② becomes zero, only D1201 is turned on.

- 16-bits data setted at steps (6), (9) and (13) are written in address A, which is selected by channel selection switch.
- Repeat the above steps to preset up to 12 channels.

(2) Functions at normal reception

• Selecting position C

- Defeat command at step (7) is reset, and AFT ON/OFF data of channel data of microcomputer are outputted. (ON/OFF data are set to ON at step (6).) MN1212A pin ③ = "0"
- Output at step (5) is returned to output at step (2).

- This step is the same as step (2) for presetting position A.

- AFT defeat is the same as step (6) for presetting position A. MN1212A pin ② = "1" → Q1208 → Sound defeat

- This step is the same as steps (10) and (13).

- Accordingly, when main power is turned off once and then turned on again, the last position (which is immediately before power turn-off) is received. (Last channel operation)

MEMO

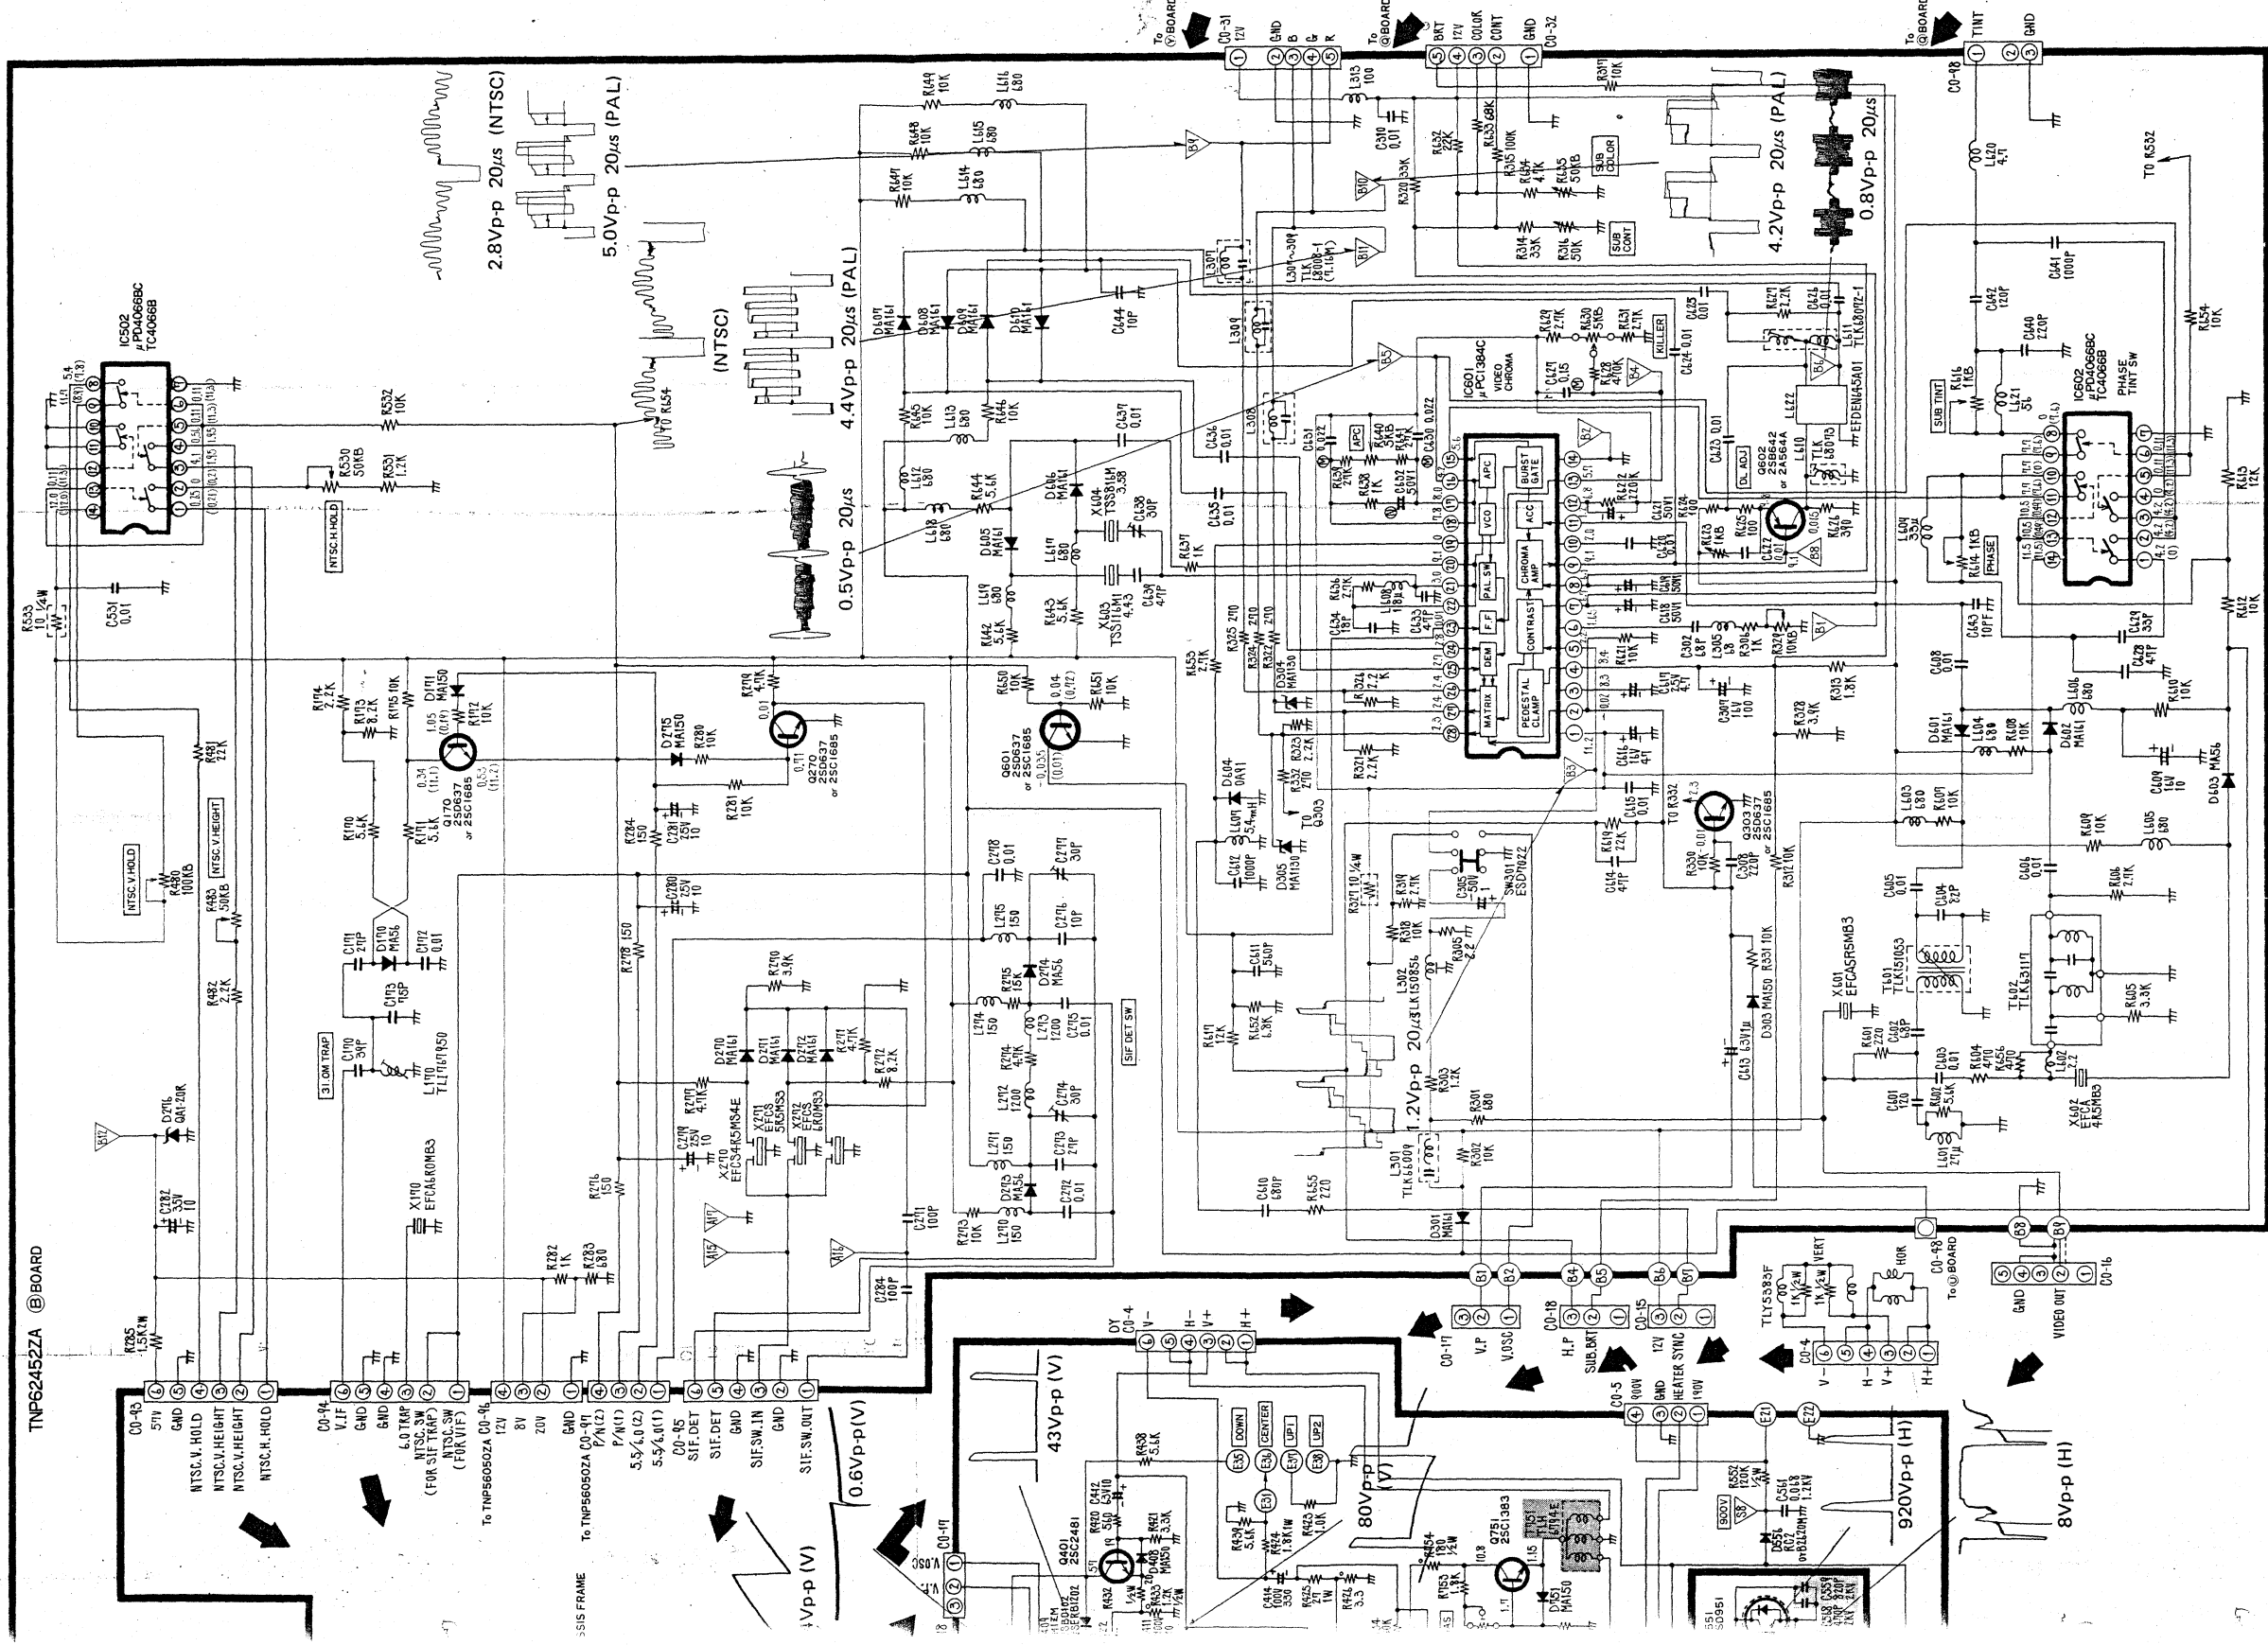

SCHEMATIC DIAGRAM FOR MODEL TC-214N

4NP/TC-214NPR (CHASSIS NO. RBX-M11E)

NOTE

1. RESISTOR
All resistors are carbon 1/4W resistor, unless otherwise noted the following marks.
Unit of resistance is OHM (Ω). (K=1,000, M=1,000,000)

- : Metal oxide resistor
- △ : Solid resistor
- : Wire wound resistor
- ⊞ : Thermistor
- ⊞ : Non inflammable resistor
- ⊞ : Fusible resistor

2. CAPACITOR
All capacitors are ceramic 50V capacitor, unless otherwise noted the following marks.
Unit of capacitance is μF, unless otherwise noted.

- ⊞ : Polyester capacitor
- ⊞ : Polypropylene capacitor
- ⊞ : Electrolytic capacitor

3. COIL

Unit of inductance is μH.

4. TEST POINT

- ▽ Test point position

5. VOLTAGE MEASUREMENT

Voltage is measured by a volt ohm meter with DC 20K OHM/V receiving color bar signal, when all controls are set to the maximum position.

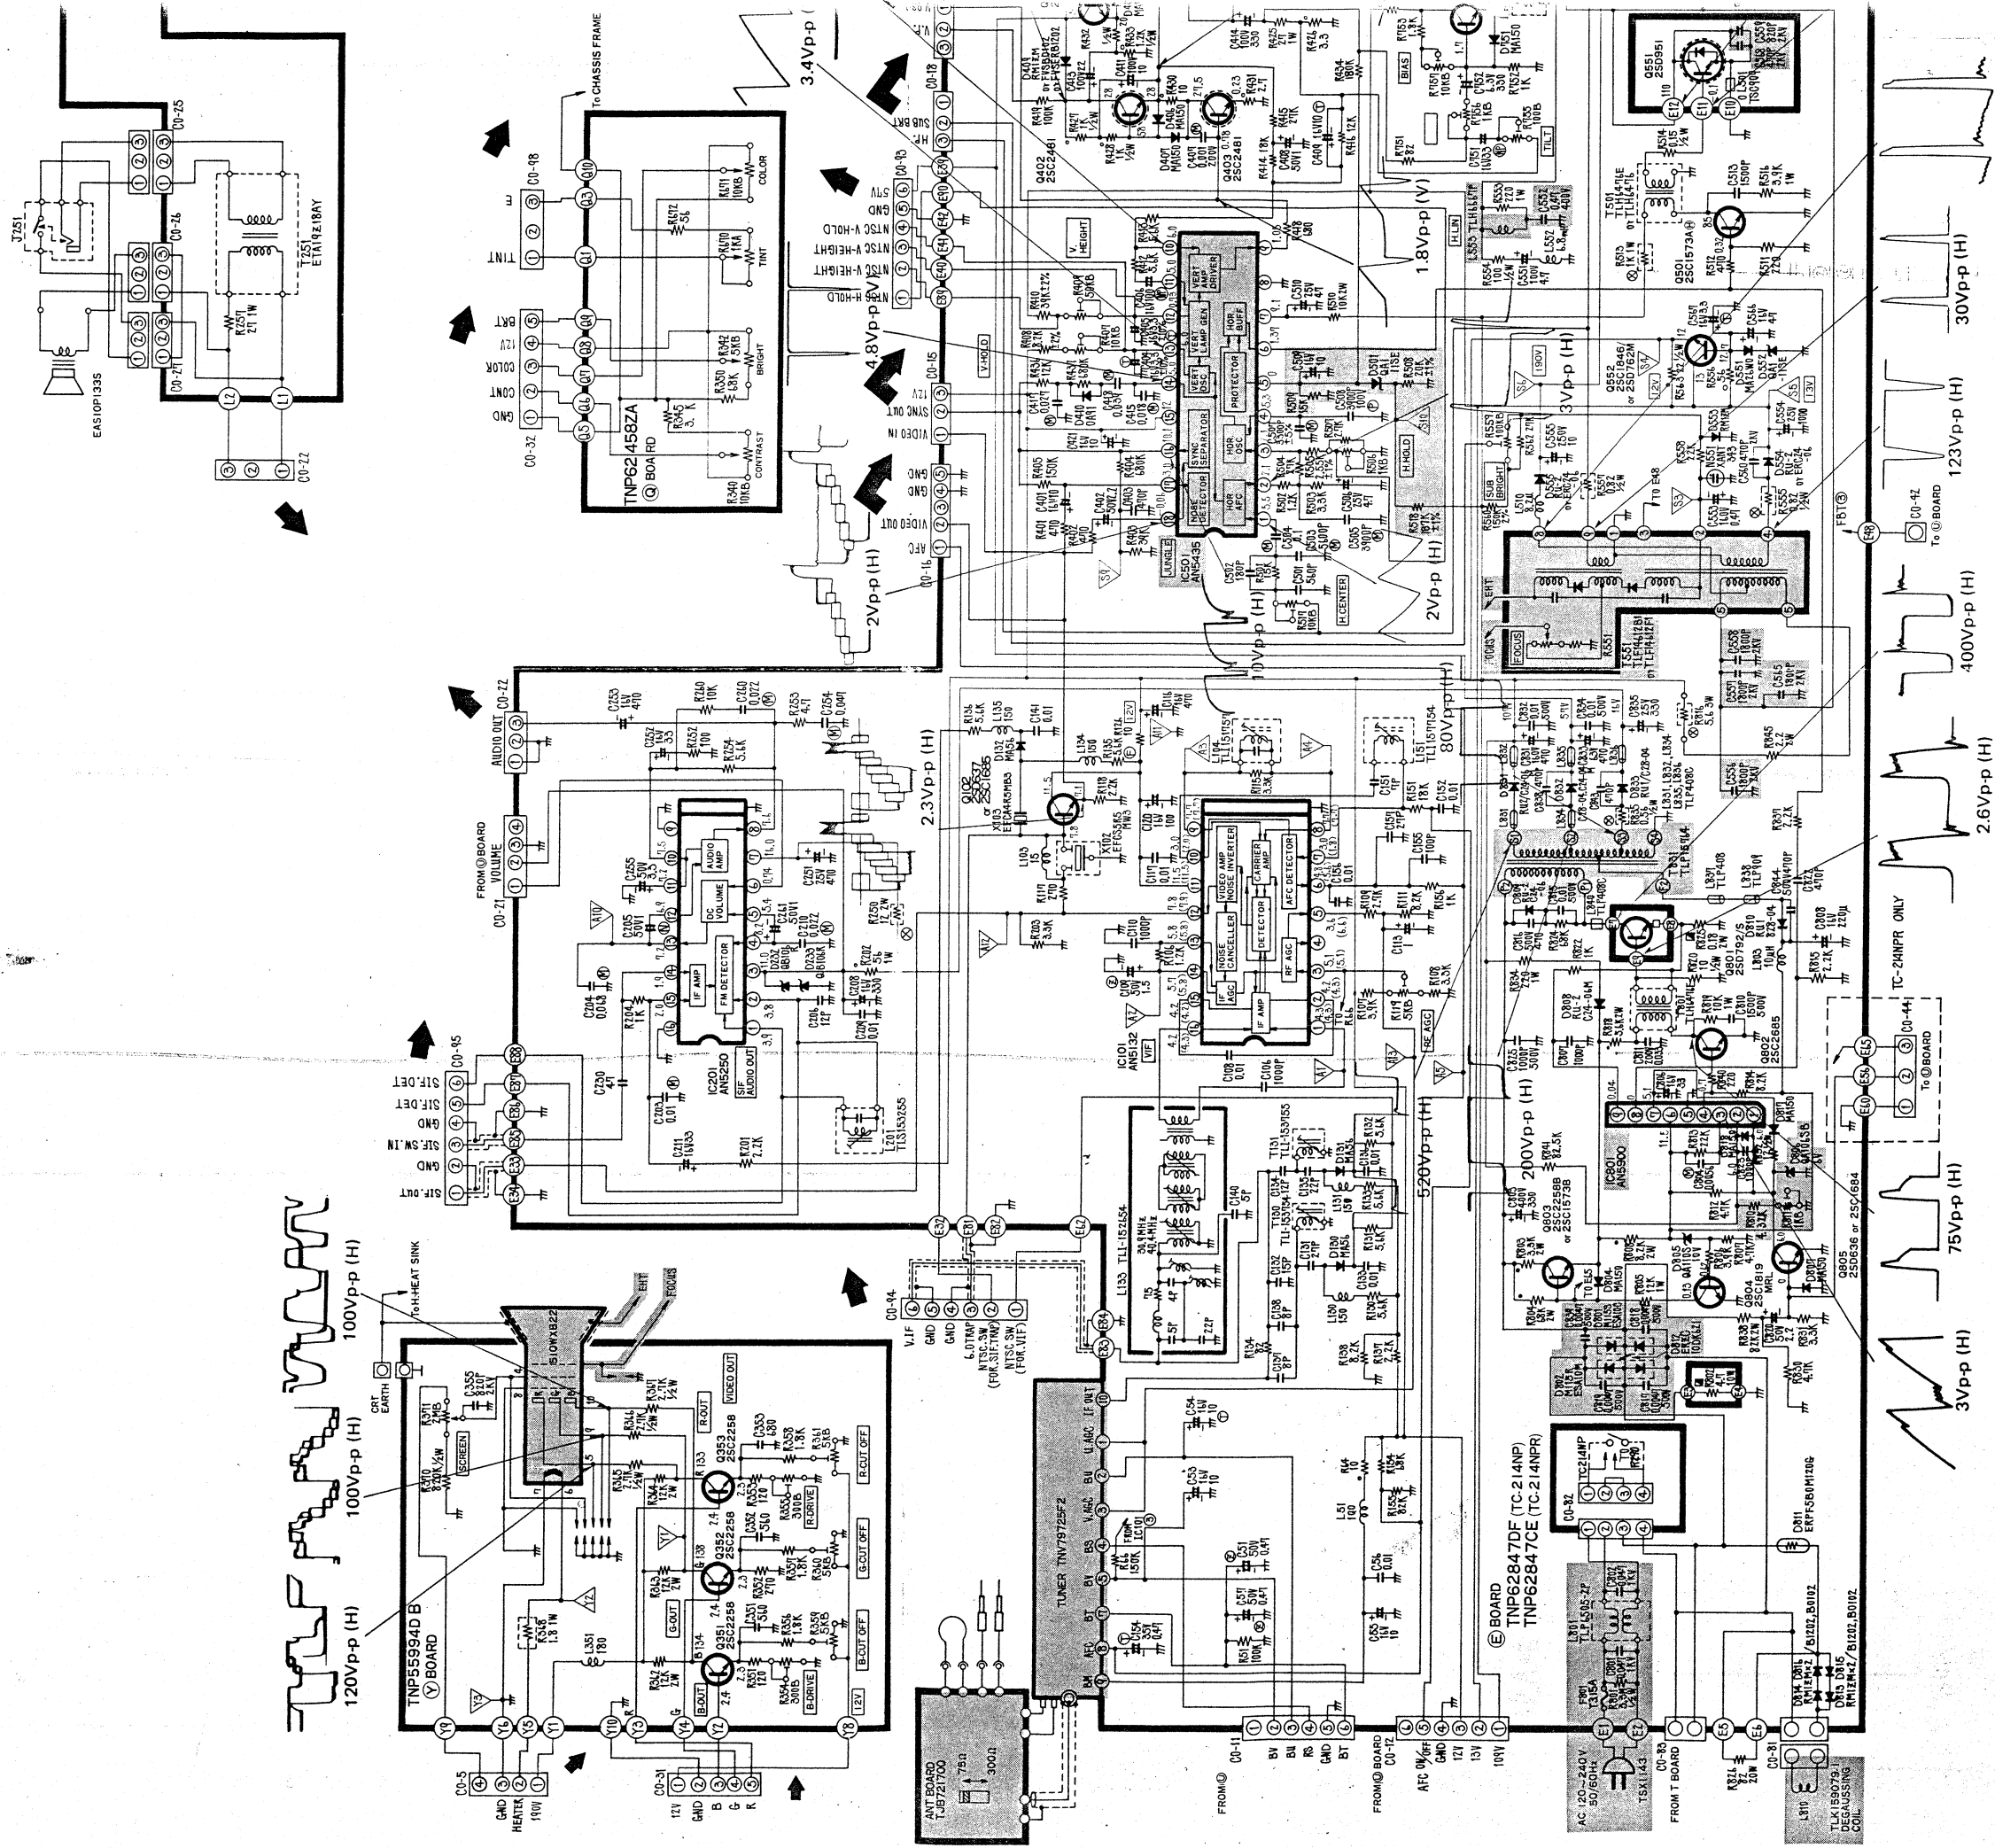

6. When arrow mark (→) is found, connection is easily found along with the direction of an arrow.

7. When schematic diagram of a board is described in more than two places, they are encircled with dotted line.....

8. This schematic diagram is the latest at the time of printing and subject to change without notice.
